

## **New Quick dis-connect tool cable connector**

A new quick-disconnect connector has been introduced for the DC Electric tools that replaces the older version. It can be ordered for both rear and top entry cables on angle and in-line tools, hand held and fixtured DEA and DEF models.

The connector is attached by screwing the two parts together, it has a ratcheting mechanism and locks firmly into place when fully seated. It is vibration proof and self tightens under vibration.

To order it, just use the Q suffix on the tool model number as before.

When tools are returned to Athens for repair, if they have the old quick disconnect connector and it is damaged or needs replacing, the customer will be contacted to return the tool cable so that the new companion connector can be fitted.

This connector is standard on Push-to-Start and DEF tools.

Whenever a spare or repaired tool is shipped to the customer, it will be shipped with a mating companion 10 ft. cable. The customer will be charged for this cable. The customer will be notified that he will get a full credit when he returns the original cable. The returned cable will have the new connector fitted and will be ready for the next occasion.
