Technical Bulletin: AS 081905 JM
Insight IC Software version 3.7.0

Description:

This is the release of version 3.7.0 for the Insight IC (QE & QM-Series) controllers. All IC systems should be upgraded to this version. Insight IC version 3.7.0 should only be used with MCE version 2.1.3.

Bug Fix Addressed:

All cells in the tool memory are now protected against change except for the TR and ASC Values (which the controller must be permitted to change for calibration purposes). This eliminates the problem of the controller corrupting the tool memory.

The tool still should not be removed from the controller while the controller is powered on. Power OFF and wait 10 seconds before removing the tool.

Restrictions:

- I. **When upgrading from any version other than 3.6.0, ALL parameters MUST BE keyed back into the system by hand. The PCMCIA or Floppy “Load Parameters” function CAN NOT be used.**

Please use the Excel Parameter Sheets provided by the Application Services team to record all the parameters for each system before the software is loaded. This helps to ensure that ALL of the necessary parameters are keyed in to the upgraded system.

- II. **In order to save disk space, only one other language besides English can be chosen for each system.**

There are four different software loads to choose from:

- IC 3.7.0 English-French.zip*
- IC 3.7.0 English-German.zip*
- IC 3.7.0 English-Italian.zip*
- IC 3.7.0 English-Spanish.zip*
